

Online Ticket Reservation and Seat Locking System

ABSTRACT

Objective:

The main objective of the online Ticket Reservation and Seat Locking system is to make ticket booking easy and convenient for users. Users can check which seats are available, select their preferred seat, and book the ticket online. When a user selects a seat, the system temporarily locks it so that another person cannot book the same seat at the same time. If the user completes the booking, the seat becomes booked. If they don't complete it within the given time, the seat becomes available again.

Existing System:

Currently, users can book tickets online by selecting a seat and making payment. The main problem is that when many users try to select the same seat at the same time, seat conflicts can occur. Our system focuses on temporarily locking the selected seat to avoid this problem.

Drawbacks

1. Sometimes the same seat may be selected by two users at the same time.
2. A selected seat may not be locked immediately.
3. The booking and payment may fail because of the network or server problem its take time to confirm.
4. Multiple users trying to book at this same time can create conflicts.
5. A selected seat may remain unavailable even when a user leaves without complementing the booking.
6. Cancelling the tickets and processing the refunds may take time.

Proposed System:

The proposed system provides online ticket reservation with a temporary seat-locking feature. Users can view available seats and select their preferred seat. Once a seat is selected, it is locked for a limited time to prevent other users from booking it. If the payment is completed within the time, the seat becomes booked. If the payment is not completed, the lock expires and the seat becomes available again. This helps to reduce seat conflicts and makes the booking process easier and more reliable.

Who can use:

Customers:

1. Register and login.
2. Select and lock the seats.
3. View available tickets and timings.
4. Confirm booking receiving the confirmation.
5. View booking history and download the tickets.

Adim:

1. Add, Edit or Delete the Schedules.
2. Manage seat availability.
3. View all bookings.
4. Manage users.
5. Check booking and cancellation details.

Booking Staff:

1. Check Bookings.
2. Check seat availability.
3. Verify customer tickets.
4. Help with booking and cancellation issues.

Roles and Responsibilities:

Customers: The responsibilities of customers can register and login to the system, search for available tickets, select a preferred seat, temporarily lock the seat, make payment, and confirm the ticket. The user can also view the booking details and cancel the ticket when required.

Admin: The admin manage the complete system, including users, events, shows, seats, bookings and cancellations. The admin can add or update the details, monitor seats availability, view booking information, and manage the overall system.

Seat Management: The seat management manages the status of seats as Available, Locked, or Booked. It updates the seat status Whenever a user selects, books, or cancels a seat.

Booking Management: This module handles ticket reservations. It stores booking details such as user, show, seat number, date, time, and booking status. After successful payment, it confirms the ticket.

Payment Management: The Payment Management handles the payment process. It checks the payment status and confirms the booking when payment is successful.

Cancellation Management: The cancellation management handles ticket cancellations. When a booking is cancelled, the system updates the booking status and makes the seat available again.
